

ASHIK SHIHAB

Product Designer · B2B SaaS · Enterprise Platforms · Design Systems

Phone: +91 9562539257 | Email: ashikshihab101@gmail.com | Portfolio: ashikshihab.me | [LinkedIn](#)

Product designer, 4 years in B2B SaaS. I make dense data products usable by the non-technical people running the business, and settle design debates with session data rather than opinion. Own end-to-end design across three products at Turbolab, including ScrapeHero (14,000+ customers, Fortune 50 among them). Built the company's first design system and lead a 5-person design sub-team.

SKILLS

Design: Product thinking · Information architecture · Interaction design · Dashboard & data-table design · Filtering and query systems · Data visualisation · Design systems & tokens · WCAG · Prototyping · Accessibility · AI-Assisted Design

Research & Data: Session recording analysis · Usage analytics · Stakeholder interviews · Usability testing · Hypothesis-driven design · Conversion optimisation · PostHog · Microsoft Clarity · GA4

Tools and Build: Figma · FigJam · Figma MCP · Lovable · ProtoPie · Claude Code · Notion · HTML · CSS · JavaScript · Adobe Photoshop · Illustrator · After Effects

EXPERIENCE

UI/UX Designer | Turbolab Technologies · Kochi, Kerala, India

Jul 2023 - Present

Sole designer on 3+ B2B SaaS products, partnering with product owners, data analysts, and engineering teams of 10 to 12.

MetricsCart (*Digital Shelf Analytics SaaS*)

- Sole designer. Turned a one-page spec into the shipped V1: 30+ screens across dashboard, explorer, filtering, and a geographic drill-down, tracking 200+ SKUs on Blinkit, Zepto, and Instamart.
- No research budget, so I derived three user types from the company's domain-expert podcast and sales-call friction, and shipped the calls proxy research couldn't settle as reversible bets.
- Built the product around change, not state. In quick commerce "54% available" carries no signal and "down 12% since yesterday" carries all of it.
- Cut a proposed 30-column table to scan-across columns plus in-row expandable detail. Shipped column filters over a chip query builder after prototyping both, and scoped the builder to v2.
- Designed a country to district drill-down that holds one map behaviour as granularity changes, swapping choropleth fill for sized incident points where "which regions" stops being the question.

ScrapeHero Cloud (*Self-serve data product & marketplace*)

- Owned UX on a live product with paying customers, three-month scope. Diagnosed drop-off from stakeholder sessions, PostHog session recordings, and Marketplace search tracking.
- Rebuilt the first-run path: login routed to the scraper listing instead of an empty dashboard, free plan given priority at the decision, and a "Create a Project" CTA replaced with "Use this scraper." Also led the team to ship tutorial videos.
- Tied the upgrade prompt to quota consumption so it fires while users still have room to act, not at the hard limit where it's already too late.
- Conversion up ~15%, drop-off down ~10% over three months, measured against PostHog before-and-after data.
- Turned repeat search misses into a build queue with the PO, and re-categorised the catalog by industry so what got built stayed findable.

ScrapeHero Data Store (*E-commerce for location datasets*)

- Rebuilt the store end to end over five months: UX, UI, and the WooCommerce and Elementor build. It had clicks but not conversion, because buyers couldn't qualify a dataset without opening it.
- Moved the decision onto the card with the four fields sales heard asked most: coverage, record count, last updated, and historical depth.
- Made each dataset's live coverage map the product page's primary image. The proof was already on the page, buried below the buy action.
- Rebuilt filters to narrow in place instead of navigating away, and routed high-margin historical data to sales at peak intent rather than building a fragile configurator.

Intell (*News-Intelligence Platform*)

- Designed multi-condition search across people, organisations, publications, and sentiment: a plain-language path for most users, a full AND/OR builder for power users.
- Added saved searches and alerts so recurring monitoring runs without rebuilding queries.

Design system and AI workflow

- Built Turbolab's first design system: tokens, data-table and filter-bar components, and page templates used across every product. A new Marketplace page went from two days with a designer and a developer to half a day with a designer alone.
- Lead a 5-person design sub-team (1 direct report, 4 dotted-line), running design QA and design system contribution reviews.
- Brought Claude Code and Figma MCP into the team's routine work, cutting turnaround on repeat tasks.

Visual Designer | Turbolab Technologies · Kochi, Kerala, India

Aug 2022 - Jul 2023

- Restructured the MetricsCart marketing site from feature-led to solution-led: ~12 qualified demo requests a month from a baseline of zero.
- Built and shipped both product marketing sites end to end in WordPress, plus the brand identity and first reusable UI patterns that became the base of the design system.

Freelance UI/UX Designer | During university

Feb 2019 – Jul 2022

- Shipped a collaboration web app for wedding photographers, end-to-end UI/UX for two e-commerce sites, and branding for international clients.

PROJECTS

Slotbox | Solo end-to-end product design · two-sided DOOH marketplace

- Concept platform where independent urban-Indian venues run their own screen promos for free, then rent out ad slots they approve.
- Reframed the pitch from "sell ad space" to "give owners control" after finding venues resist ads to protect their walls, not to avoid money.
- Two surfaces to opposite needs: a phone-first owner app usable one-handed, and an analytics-first advertiser dashboard. Chose flat weekly pricing over CPM for lower friction on small local buys.

EDUCATION

B.Tech, Electronics and Communication Engineering

Aug 2018 - Jul 2022

A. P. J. Abdul Kalam Technological University
